Can multi-pile foundations be used in high-capacity offshore wind turbines?

In China, due to the unique geological conditions in the Jiangsu region, multi-pile foundations have been widely applied in high-capacity offshore wind turbine projects, such as the 4 MW, 5 MW, and 6 MW wind turbines in the Jiangdong intertidal demonstration wind farm, as well as the 2.5 MW test wind turbines from Goldwind Technology Co., Ltd.

How does a wind turbine foundation work?

The load from the wind turbine is transmitted through the central column to the reinforcing ribs and the steel skirts. After installation, the foundation requires friction balance between the foundation and the bucket wall.

Does a single pile foundation need a transition section?

In the offshore wind farms already erected in China, a revolutionary single pile foundation devoid of a transition section has been successfully developed and extensively applied, with a levelness of up to 0.2°, much below the levelness requirement of the foundation top flange.

How do you connect a single pile foundation to a tower?

Due to the fact that the piles and towers of the single pile foundation are both tubular, it is very convenient to connect them on site by directly employing flange bolts. To assure the levelness of the infrastructure, transition sections are generally deployed internationally.
