---

Thin-film solar cells are a type of solar cell made by depositing one or more thin layers (thin films or TFs) of photovoltaic material onto a substrate, such as glass, plastic or metal.

Thin-film solar panels are made of very thin layers of photovoltaic materials, making them extremely lightweight and sometimes even flexible. You'll find them primarily used in industrial ...

Learn about the different types of thin-film solar panels and how they differentiate on materials, cost, performance, and more.

In a groundbreaking study published in Nature, scientists developed two-terminal monolithic perovskite/silicon tandem solar cells, ...

OverviewHistoryTheory of operationMaterialsEfficienciesProduction, cost and marketDurability and lifetimeEnvironmental and health impactThin-film solar cells are a type of solar cell made by depositing one or more thin layers (thin films or TFs) of photovoltaic material onto a substrate, such as glass, plastic or metal. Thin-film solar cells are typically a few nanometers (nm) to a few microns (um) thick-much thinner than the wafers used in conventional crystalline silicon (c-Si) based solar cells, which can be up to 200 um thick. Thi...

In a groundbreaking study published in Nature, scientists developed two-terminal monolithic perovskite/silicon tandem solar cells, achieving a certified power conversion ...
