Generators for a power plant serving an installation will be in the range from 4160 volts to 13.8 kV to suit the size of the unit and primary distribution system voltage.

What Does The Future Hold For Power Plants?  
We'll always need energy and especially electricity--a very versatile kind of energy we can easily use in many different ways--but that doesn't mean we'll always need power plants like the ones we have today. Environmental pressures are already forcing many countries to close coal-fired power plants that produce the greatest carbon dioxide emissions (resp... OverviewTechnologiesHistoryMethods of generationEconomicsGenerating equipmentWorld productionEnvironmental concernsCentralised energy sources are large power plants that produce huge amounts of electricity to a large number of consumers. Most power plants used in centralised generation are thermal power plants meaning that they use a fuel to heat steam to produce a pressurised gas which in turn spins a turbine and generates electricity. This is the traditional way of producing energy. This proc...
