What are the basic parts of an LTE base station?

The basic parts of an LTE base station include the baseband part, which handles data processing and signaling and decides the capacity of the system, and the radio part, which converts digital data into RF signals, filters, and amplifies the RF signal, and decides the coverage of the system.

What are the main functions of a base station?

A base station in an LTE network performs several functions, including: managing the whole base station system, providing the physical interface between the base station and the core network, processing and transferring the uplink and downlink data packages, and providing the system clock. It also offers the interface to the Remote Radio Unit (RRU) and handles operating/maintenance and signaling processing.

What are the different types of base stations?

In the LTE Network, there are several types of base stations. Distributed base stations have a remote radio unit (RRU) on the tower and use optical fiber to transfer data, allowing for flexible deployment. Another type is the integrated base station, which integrates the antenna with the RRU and uses technology like Massive MIMO. Lastly, there's the LTE Base Station - eNodeB, which includes a Building Baseband Unit.

What features are included with the mts4 basestation equipment?

Full redundancy of site controller and base radio subsystems including support for automatic Main Control Channel switching. With the MTS4, there is no need to worry about theft or vandalism. The basestation equipment includes the latest security features for total peace of mind:

Two E1 or Ethernet interfaces can be provided with the MTS4 to facilitate implementing link redundancy using ring configurations. Redundant E1 and Ethernet ports can be activated in ...

The E-UTRAN handles the radio communications between the mobile and the evolved packet core and just has one component, the evolved base stations, called eNodeB or eNB.

Base station equipment includes the hardware installed at cell towers--antennas, radios, and processing units--that communicate with ...

Star Solutions RAN equipment offerings include 5G NR gNodeB, 4G LTE eNodeB, CDMA and GSM base station products.
