Does airflow organization affect heat dissipation behavior of container energy storage system?

In this paper, the heat dissipation behavior of the thermal management system of the container energy storage system is investigated based on the fluid dynamics simulation method. The results of the effort show that poor airflow organization of the cooling air is a significant influencing factor leading to uneven internal cell temperatures.

Why is a stationary energy storage system difficult to optimize?

Due to the huge scale, complex composition, and high cost of stationary energy storage systems, it is difficult to optimize its parameters and structures by direct experimental research.

What is a container energy storage system?

Containerized energy storage systems play an important role in the transmission, distribution and utilization of energy such as thermal, wind and solar power [3, 4]. Lithium batteries are widely used in container energy storage systems because of their high energy density, long service life and large output power [5, 6].

How much power does a containerized energy storage system use?

In Shanghai, the ACCOP of conventional air conditioning is 3.7 and the average hourly power consumption in charge/discharge mode is 16.2 kW, while the ACCOP of the proposed containerized energy storage temperature control system is 4.1 and the average hourly power consumption in charge/discharge mode is 14.6 kW.

In order to explore the cooling performance of air-cooled thermal management of energy storage lithium batteries, a microscopic experimental bench was built based on the ...

The air-cooled system has the advantage of being simple in construction, easy to maintain, and low in cost. However, air has a low ...
