What is Bess & how does it work?

BESS stores surplus energy generated from renewable energy sources such as wind and solar. This stored energy can be released when demand exceeds production. This technology plays a crucial role in integrating renewable energy into our electricity grids by helping to address the inherent supply-demand imbalance of intermittent renewable sources. 2.

What are the risks associated with Bess projects in the Nordics?

However, several fundamental risk parameters specific to BESS projects in the Nordics need to be addressed by the project owners. These include natural catastrophe (NatCat) risks from extreme weather, such as heavy snowfall, storms, or flooding that can damage installations and allow water to reach batteries, which must remain dry.

How much power does a Bess have?

The system is built of two main blocks. The PCS building block, responsible for the main control of the mobile BESS. The nominal power rating of the PCS block is 225 kVA, with a maximum peak power in the peak shaving mode of 275 kW. The second block is the modular battery pack.

Why should you choose a Bess energy storage system?

The mobility and flexibility of the system enables novel applications and deployments where BESS previously were unused due to the non-flexible solutions. The system is modular, meaning that the energy storage capacity can be quickly adapted depending on the application case, in contrast to larger and bulkier solutions.

The faster response times and flexible service capability of the BESS enables the introduction of variable renewable energy sources, along with replacing the needs for traditionally fossil fuel ...
