What are the key requirements for 5G infrastructure?

From the trends and challenges mentioned above, we can derive three key general requirements for the 5G infrastructure:

- o High efficiency. Achieving high efficiency is the best way to reduce heat dissipation (due to high power consumption compared to 4G) and operational expenses (OPEX).
- o Re-use of existing infrastructure.

Why are small- and micro-sites important in the 5G era?

Small- and micro-sites gain growing importance and become key structures in the 5G era. The harsh environment where they typically work makes especially those systems susceptible to the power supply reliability. Similar requirements can also affect the MEC systems, especially when these are located in outdoor environments.

Will 5G change our lives?

The 5G spectrum has been released in several countries worldwide and already in commercial use. 5G is accelerating and promises to change our lifestyles to large bandwidth, massive connection, and ultra-low latency. On top of this network evolution, we need to consider the advancements in the so-called mobile edge computing (MEC) area as well.

This report provides a comprehensive analysis of the power supply market for base stations, segmented by application (4G and 5G base stations) and type (All-in-One and ...

Thus, telecom sites must be accurately re-designed, starting from the power supply units (PSUs), which will be replaced by new ones with higher output power and typically higher ...

Summary
References
The requirements mentioned above for 5G infrastructure translate into some key features required for AC-DC SMPS in the latest generation of telecom applications. Figure 1 below summarizes these features. Power density is a consequence of higher power requirements in the same form factor as previous SMPS, allowing the re-use of the old cabinets. Also...
