Can energy storage systems be used for emergency use in data centers?

Overall, the results indicate that energy storage systems (EES) designed for emergencies can yield positive profits through participation in grid interactions. Under both electricity markets, Scenario 1 emerges as the optimal design option for deploying EES and TES for emergency use in data centers. 6.

What is unused energy storage capacity in a data center?

In the context of progressive loading, there is unused energy storage capacity in emergency systems, which is named surplus capacity. The surplus energy storage can be flexibly scheduled at each stage throughout the data center's lifecycle, without compromising the reliability of the data center.

What is the optimal design option for energy storage systems in China?

Under the Guangdong electricity market in China when the discount rate is set at 4 % and the annual decline rate of battery price is 5 %, Scenario 1 is identified as the optimal design option for deploying Energy Storage Systems (EES) and Thermal Energy Storage (TES) for emergency use in data centers.

What is an energy storage system for emergencies?

In Scenario 1, the energy storage system for emergencies is a one-time investment and provides auxiliary services to the grid throughout the data center's lifecycle, utilizing the surplus energy storage capacity. In Scenario 2, the energy storage system for emergencies is a phased investment based on progressive IT loading.
